

Laundo Screen Actions

For every screen sent through so far: what fills it, **which route the button actually calls**, and the panel page an operator does the matching job from. Paths read from `artisan route:list`.

FEED — the reads that draw the screen. **ACTION** — what a tap writes. This is the axis.

PANEL — where staff perform or answer it.

Onboarding 3 screens

on1 ×3	شاشات الترحيب	FEED	GET	/api/v1/intros	public — runs before an account exists
		ACTION	None. «التالي» and «تخطي» only move the pager — nothing is written, and nothing is remembered server-side.		
		PANEL		/admin/intro/create	
				/admin/intro/edit/{id}	copy, illustration, order
			POST	/admin/intro/status/{id}	retire a slide without deleting it
		CONTENT	All three slides are written in Arabic. The illustrations are placeholders — they need exporting from Figma as PNG under 2 MB.		

تسجيل الدخول

FEED	GET	/api/v1/pages/terms	the two footer links
	GET	/api/v1/pages/privacy	
ACTION	POST	/api/v1/auth/login	«تسجيل الدخول»
	POST	/api/v1/auth/forgot-password	
			«نسيت كلمة المرور» — sends the code
	POST	/api/v1/auth/verify-reset-code	
			spends the code, returns a single-use ticket
PANEL	POST	/api/v1/auth/reset-password	takes the ticket, never the code
	POST	/admin/user/status/{id}	
			suspend an account, so login is refused
	POST	/admin/PrivacyAndTerms	edits both documents, per language
MISSING SCREEN Reset is three calls and the Figma has two screens for it. The «كلمة «مرور جديدة» screen is missing — the verification screen in the file is the registration one, its button reads «تحقق».			

إنشاء حساب

ACTION	POST	/api/v1/auth/register	
			name, phone, optional email, password, accepted_terms
PANEL		/admin/user/create	staff can open an account by phone
		/admin/user/show/{id}	
			reads back the consent date and the verification date
DESIGN The route requires accepted_terms and the screen has only footer links — no checkbox. Consent is recorded and shown in the panel; the control itself is a Figma change.			

التحقق من الهاتف

ACTION	POST	/api/v1/auth/verify-otp	6 digits — the six boxes
	POST	/api/v1/auth/resend-otp	
			«إعادة إرسال», throttled per number and per address
PANEL	No panel page — deliberately.		
			Length and lifetime are environment settings: OTP_LENGTH = 6, OTP_TTL_SECONDS = 120 — which is the 01:59 the screen counts down.

الرئيسية

no /home endpoint

FEED

- GET `/api/v1/profile` the name in the greeting, and the avatar
- GET `/api/v1/addresses` the address strip — the default is element 0
- GET `/api/v1/notifications/unread-count` the bell
- GET `/api/v1/banners` the hero carousel
- GET `/api/v1/offers`
- عروض متميزة — badge derived from the linked coupon
- GET `/api/v1/journey-steps`
- رحلتك معنا بسيطة — the number is the position
- GET `/api/v1/orders?tab=active` طلبك الحالي, with its window and QR
- GET `/api/v1/app-settings` the currency every price is formatted in

ACTION

- POST `/api/v1/notifications/read-all` the only write on this screen
- Every other tap navigates. Tapping an offer card writes nothing — it carries `offer_id` into the wizard, which is how «which card won which order» gets answered.*

PANEL

- `/admin/banner/create` · `/admin/banner/edit/{id}`
- `/admin/offer/create` · `/admin/offer/edit/{id}`

where the coupon is linked

- `/admin/journey-step/edit/{id}`
- POST `/admin/generalSetting/updateGeneralSetting`
- currency, tax, cash surcharge

Placing an order 5 steps + confirmation

1 تاريخ ووقت الاستلام

FEED

- GET `/api/v1/time-slots?date=`
- windows carrying `remaining` and `is_full`, so a full one greys out

ACTION

- Nothing written. The slot is held in the wizard and travels with `POST /orders` at step 5 — no slot is reserved before the order exists.*

PANEL

- `/admin/time-slot/create` · `/admin/time-slot/edit/{id}`
- the windows and their capacity

DESIGN

Slots are *windows* («04:00 PM – 06:00 PM»), on purpose: a driver on a route cannot promise a minute. The card showing «مساءً 4:30» has to show the range.

2 اختر الخدمة

FEED

- GET `/api/v1/services` name, icon, `pricing_mode`, turnaround

ACTION

- Selection only — travels as `service_id`.*

PANEL`/admin/service/create` · `/admin/service/edit/{id}`

INCOMPLETE Turnaround arrives as "24-48" plus "hour", and the Arabic file has no `hours` or `days` key — the app can neither compose «24-48 ساعة» nor translate it. «حسب النوع والحجم» is not a duration; it is `pricing_mode: quote`.

3 حدد القطع**FEED****GET** `/api/v1/catalog?service_id=`

service → categories → items; the tabs are the categories

ACTION**POST** `/api/v1/orders/quote`

recalculates the footer's «التكلفة التقديرية» on every ± tap. Creates nothing.

PANEL`/admin/item-category/edit/{id}` the tab strip and its order`/admin/item/create` · `/admin/item/edit/{id}``/admin/pricing/create` · `/admin/pricing/edit/{id}`

the item × service price matrix — this is where a number changes

INCONSISTENT The two routes this one screen calls disagree about money: `/catalog` sends `price` as the string "17.00", `/orders/quote` sends floats.

**4 عنوان الاستلام
والتوصيل****FEED****GET** `/api/v1/addresses`**GET** `/api/v1/cities` the city field, with zones**ACTION****POST** `/api/v1/addresses` «إضافة عنوان جديد» — carries the driver note**PUT** `/api/v1/addresses/{id}` the : menu's edit**PUT** `/api/v1/addresses/{id}/default`**DELETE** `/api/v1/addresses/{id}`

promotes a successor — never leaves the customer with no default

PANEL*No address module at all.*An address is only visible inside `/admin/order/show/{id}` or`/admin/recurrence/show/{id}`, and read-only there. The customer page does not list them.

PANEL GAP A customer who rings to say their address is wrong cannot be helped: there is no page to look at it on and no route to correct it — the four writes above exist only in the app.

5 مراجعة الطلب**FEED****POST** `/api/v1/orders/quote`

the summary's figures, re-priced once more

ACTION	POST	/api/v1/coupons/check	prices a typed promo code before submitting
	POST	/api/v1/orders	the order is created here. Requires <code>accepts_review_terms</code> ; carries both handover methods and, if there was a card, <code>offer_id</code>
PANEL		/admin/coupon/create · /admin/coupon/edit/{id}	codes, ceilings, windows
		/admin/order	where it lands, seconds later
RULE One discount per order. A typed code <i>or</i> an offer from the home carousel — never both. The offer wins, because it is what the card promised, and a code sent alongside it is refused with a message rather than silently dropped. Refused at the quote too, which is where the customer is actually deciding.			

تم إنشاء طلبك بنجاح

FEED	–	the 201 body of <code>POST /orders</code> . Nothing extra to call.	
ACTION	<i>None — both buttons navigate.</i>		
PANEL	POST	<code>/admin/order/task/generate/{id}</code>	builds the two legs
	POST	<code>/admin/order/task/assign/{id}</code>	a driver per leg
	PUT	<code>/admin/order/assign/{id}</code>	which laundry does the work
DESIGN	The card contradicts itself — the badge reads «سعر تقديري» and the row beneath it «الإجمالي النهائي». It should read «الإجمالي التقديري»: no final price exists until the pieces are counted.		

Tracking 2 screens — the busiest actions in the app

تتبع الطلب

FEED	GET	/api/v1/orders/{id}/track	the timeline, the driver card, the live dot
	GET	/api/v1/orders/{id}	the pricing lines, the QR, handover, ETA
	GET	/api/v1/orders/{id}/review	estimated vs final counts
ACTION	POST	/api/v1/orders/{id}/confirm	accepts the re-count — this is the step the order is waiting on
	POST	/api/v1/orders/{id}/dispute	rejects it, and opens a complaint
	POST	/api/v1/orders/{id}/queries	answers a question staff asked
	PUT	/api/v1/orders/{id}/cancel	only while it is still cancellable
	POST	/api/v1/orders/{id}/reschedule	moves the window
	POST	/api/v1/orders/{id}/rating	after delivery

PANEL

POST

/admin/order/review/{id}

the count that turns the estimate into a final price

POST

/admin/order/query/{id}

asks the customer something

POST

/admin/order/task/release/{id}

takes a leg off a driver

/admin/order/show/{id}

· /admin/driver

· /admin/complaint

The two pairs to hold onto. Staff post /admin/order/review/{id} ; the customer answers with /orders/{id}/confirm or /orders/{id}/dispute . Staff post /admin/order/query/{id} ; the customer answers with /orders/{id}/queries . Both halves are live — neither is a stub.

SIX, NOT FIVE The timeline has six points and this screen draws five. «تم تأكيد السعر» stays: it is the only step waiting on the customer, and hiding it hides why nothing is moving. Two other mocks in the file already include it.

THIRD CALL «تم العثور على قطعة إضافية» cannot be drawn from /track . It needs /orders/{id}/review and a comparison of estimated.items_count against final.items_count ; the operator's sentence is that response's note .

DRIVER CARD Name, rating and phone come from /track — the number only while that leg is live, gated exactly as the live dot is. Address, ETA and handover come from /orders/{id} , so the card as drawn needs both. There is **no chat route anywhere**: the message button has nothing behind it and should come off the design.

Payment 2 screens

الدفع

FEED

GET

/api/v1/payment-methods

card, wallet, InstaPay, cash — all four, unfiltered

GET

/api/v1/orders/{id}

the التنظيف / التوصيل / الخصم lines

GET

/api/v1/wallet

the balance shown beside the wallet option

ACTION

POST

/api/v1/orders/{id}/pay

body is {method} only — the server takes the amount, never the client

POST

/api/v1/coupons/check

if a code is entered here instead

POST

/api/v1/orders/{id}/refunds

asks for money back after the fact

PANEL`/admin/payment`

read-only — no write route exists, on purpose: a payment is settled by the gateway, not by staff

POST `/admin/refund/approve/{id}` · `reject/{id}` · `settle/{id}`

`/admin/wallet` balances, adjustments, freezes

`/admin/order/invoice/{id}` the printable invoice

CORRECT AS DRAWN An estimate cannot be paid — `/pay` refuses with `no_final_price`. So this screen's «سعر نهائي» badge holds by construction, not by the app checking.

NO GATEWAY Only a stub provider exists and `redirect_url` points at a placeholder. InstaPay is a value in the enum, not an integration.

تم الدفع بنجاح**FEED**

GET `/api/v1/orders/{id}/payments`

polled until `paid` turns true; «رقم المعاملة» is `transaction_reference`

ACTION

POST `/api/v1/payments/webhook/{provider}`

not the app's call — the gateway's. It is the only thing that marks an order paid.

PANEL

`/admin/payment` · `/admin/order/invoice/{id}`

WHY POLLING A payment settles on the webhook and on nothing else — not on the redirect the customer returns through, which they can close. So this screen has to wait on `/payments`; it is never told directly.

102 endpoints under `/api/v1` — 41 of them writes; 238 under `/admin`. Verified with `artisan route:list`, not from memory.

Everything under a red marker is recorded in `tasks/todo.md` with its reasoning. None of it blocks building these screens.
